

ONE SCENE · FOUR MODES

Start here

LUMEN STAGE keeps the subject, lights, camera and stage in one live scene. Change the controls without losing what you have already arranged.

- Work left to right: Person → Light → Camera → Layout.
- Use the shelf view to arrange; use Viewfinder to judge the crop.

LEFT · CENTRE · RIGHT

The workspace

The left side lists the shoot and stage objects, the centre is the live 3D studio, and the right side changes with the selected mode and object.

- Select an object before editing it.
- The bottom tools move, rotate, aim and measure.

SUBJECT · HEIGHT · POSE

Person

Choose feminine, masculine or neutral, then set height, Y position, age, body preset, pose and appearance from one place.

- Y position places feet on platforms or lower floors.
- The model shown here is a working placeholder and can be replaced later.

BUILD ONLY WHAT THE SHOT NEEDS

Add to stage

Use Add to stage at the lower left for people, products, chairs, tables and backdrops. Type-specific choices happen while adding—not again in the inspector.

- Choose the person type before it enters the scene.
- Keep the stage list short so selection stays fast.

ONE LIGHT AT A TIME

Light

Select a light, then adjust output, distance, angle, colour and modifier. Move, rotate or aim it directly in the scene when a slider is not enough.

- Name lights by role: Key, Fill, Rim or Background.
- Use exposure analysis for clipping and balance—not as a real meter replacement.

PLACE OBJECTS ON X · Y · Z

Layout

Select an object in the stage list, then set horizontal, height and depth position precisely. Layout is for placement, so creative person controls stay out of the way.

- Use Y to put people or products on platforms.
- Lock a finished position before adjusting another object.

CHECK BEFORE YOU COMMIT

Compare and reset

Each major settings group can compare before and after or reset independently. Use the fixed footer for a full reset, opening presets or saving the current setup.

- Reset one section when the rest of the scene is already good.
- Preset names should describe the result, not the slider values.

LOCAL FIRST · BACK UP OFTEN

Save and hand off

The scene is saved in this browser. Use More to import or export a portable project, copy a review link, open the setup sheet or change language.

- Export before clearing browser data or changing devices.
- The setup sheet is the crew-friendly version of the scene.

SAME SCENE · FEWER CONTROLS

Phone and simple UI

Phone and simple UI use the same four modes and scene data. They keep the controls needed on set while leaving dense desktop-only options behind.

- Use the large shutter control for a quick frame capture.
- Return to desktop for detailed gear and preset management.
